

# 2012

## Consumer Confidence Report for Central Marina and Ord Community

**M**arina Coast Water District is proud to present the 2012 Consumer Confidence Report. This annual water quality report includes information about where your water comes from, what it contains and how it compares to drinking water standards. As in the past, the District gives you the assurance that your drinking water meets stringent California and Federal drinking water standards.

If you have any questions regarding the information in this report or about your water, please contact our Laboratory Supervisor, Thomas Barkhurst, at 384-6131. You can also visit our website at [www.mcwd.org](http://www.mcwd.org)

### Water Supply and Treatment

**T**he District provides groundwater produced from eight wells delivered through a distribution system network of seven storage tanks and one hundred sixty miles of pipeline.

Three deep supply wells (10, 11, and 12) located in Central Marina draw groundwater from the 900-foot aquifer of the Salinas Valley Groundwater Basin. The groundwater is treated at each well site for disinfection and to remove naturally-occurring hydrogen sulfide that can cause odor problems.

Five supply wells (29, 30, 31, 34 and Watkins Gate) located in the Ord Community draw groundwater from the Salinas Valley Groundwater Basin 900-foot, 400-foot and lower 180-foot aquifers. Groundwater from these supply wells is disinfected in the Ord Community chlorination treatment plant.

In 2005, the Central Marina and Ord Community water systems were connected to allow water to flow between the systems to meet peak demands and improve overall service.

### Water Supply Assessment and Protection

**T**he District remains committed and encourages our customers to be vigilant and join our efforts to protect our precious water resources.

In July 2001, the California Department of Public Health (CDPH) completed an assessment of each groundwater supply well in Central Marina, which concluded they are most vulnerable to historic waste dumps, landfill activities and military installations. The desalination plant seawater intake well is considered most vulnerable to salt water intrusion and to contaminants associated with injection wells.

In February 2002, an assessment was completed of the groundwater supply wells in the Ord Community. The well field is considered to be most vulnerable to known

volatile organic contaminant plumes from the closed landfill on the former Fort Ord, as well as most vulnerable to saltwater intrusion, sewer collection system, above ground storage tanks, irrigated crops, transportation corridors, farm machinery repairs and septic systems. A preliminary assessment (final is to be completed in 2013) for Well 34 was completed in January 2011 prior to well construction. Well 34 is considered most vulnerable to that mentioned above in the Ord Community and to the Storm Drain Detention Facility and Military Installation (former Fort Ord). An assessment for the Watkins Gate Well was conducted in November 2012. Watkins Gate Well is considered most vulnerable to Military Installations.

Full details of the assessment may be viewed at the following locations: MCWD, 11 Reservation Road, Marina, CA, or at CDPH, 1 Lower Ragsdale Drive, Building 1, Suite 120, Monterey, CA.
