

Lead Inventory

Marina Coast Water District has completed the initial lead service line inventory required by U.S. EPA's Lead and Copper Rule Revisions. The deadline for the initial inventories is October 16, 2024.

Through completing a historical records review and field investigations, Marina Coast Water District has determined it has no lead or galvanized requiring replacement service lines in its distribution system. This includes any privately-owned or customer-owned service lines.

Marina Coast Water District has reviewed all applicable sources of information, including:

- All construction and plumbing codes, permits, and existing records or other documentation which indicates the service line materials;
- All water system records, including distribution system maps and drawings, historical records on each service connection, meter installation records, historical capital improvement or master plans, and standard operating procedures;
- All inspections and records of the distribution system that indicate service line material, including inspections conducted during the course of normal operations (e.g., checking service line materials when reading water meters or performing maintenance activities); and
- All previous service line or meter replacements that were conducted.

In addition to reviewing the above sources of information, Marina Coast Water District physically inspected or used State Water Resources Control Board Division of Drinking Water-approved interpolation methods to determine service line materials on all service lines built prior to the 1986 no-lead ban (Health and Safety Code 300.6). The interpolation method is used when the water utility can divide their service area into uniform groups, such as neighborhoods or tracts. Each uniform group shares multiple common characteristics, such as the time period built, location, or contractor. The service line materials for each group are assumed to be similar. Water utilities physically verified a percentage of the buildings in that group to interpolate or determine the service line material for the remaining buildings. Interpolation was used by Marina Coast Water District on large building complexes such as apartment complexes and mobile home complexes. All service lines were verified as non-lead within the Marina Coast Water District's entire service area.
